

ABSTRACT OF THE DISCLOSURE

A processing of a first slaughter product to form a second slaughter product comprises: providing one or more processing stations, a parameter of a processing to be carried out in the processing stations being adjustable; collecting and storing data indicating the availability of the processing stations; collecting and storing data which indicate the availability of the first and/or second slaughter product; collecting and storing properties of the first and/or second slaughter product; storing relationships between the parameter of the processing and the properties of the first and/or second slaughter product. The processing of the first slaughter product to form the second slaughter product is controlled by adjusting the parameter of the processing on the basis of said data, properties and/or relationships, such that an additional added value is obtained during the processing of the first slaughter product to form the second slaughter product.
